

Rehab Saskatoon

Rehab Saskatoon - EECF therapy is a relatively new outpatient treatment used for angina and heart failure. Sufferers of heart ailments may find the simple daily activities rather challenging. Activities such as getting the mail or walking the dog may present certain difficulties. If you or perhaps somebody you know experiences heart failure or angina, the non-invasive treatment called EECF therapy can prove useful. Statistics prove that about 80% of patients who complete the 35 hour course of EECF therapy report significant symptom relief which can last up to 3 years.

EECF therapy has been proven useful for angina and heart failure treatment. Treatments could be given for an hour a day, up to 5 days a week for as many as 35 hours. A treatment would normally require lying on a table using big blood pressure like cuffs wrapped around your buttocks and legs. At particular times in between your heartbeats, these cuffs deflate and inflate. A continuous ECG or electro cardiogram is used to be able to set the timing. This insures that the cuffs inflate while the heart is in its resting condition where it normally receives its supply of oxygen and blood. After that the cuffs deflate at the end of that rest period, just before the next heartbeat. The patient puts on a special sensor on their finger in order to monitor the blood's oxygen levels. The sensor likewise monitors the pressure waves created by the cuff inflations and deflations.
